

Analytical methods to verify compliance with microbiological criteria

Published by AGRINFO on 11 Jun 2024; Revised 17 Jul 2024

EU proposes rules on specific methods of laboratory analyses to verify compliance with microbiological hygiene criteria

Draft Commission Implementing Regulation laying down analytical methods applicable to official controls performed for the verification of compliance of food business operators with Regulation (EC) No 2073/2005

Update

The European Union proposes to establish rules for specific methods of laboratory analyses to be used during official controls to verify compliance with the microbiological hygiene requirements.

Impacted products

All food

What is changing?

The EU proposes to define the methods that reference laboratories can use during official controls to verify operators' compliance with the microbiological hygiene requirements laid down in Regulation 2073/2005.

Reference laboratories will be able to use the same methods as operators, that is, the analytical reference methods referred to in Regulation 2073/2005, Annex I, chapter 3. Alternative methods, including proprietary ones, may be used only if they are validated against the analytical reference methods referred to in Annex I, or if they are validated against other internationally accepted scientific protocols.

Proprietary methods must be certified by an independent certification body, and re-evaluated every 5 years (Art. 1.3).

Why?

The aim of the proposed regulation is to give official laboratories access to more methods than those currently recognised internationally or by the European Committee for Standardisation (CEN) (Art. 34 of the Official Controls Regulation [2017/625](#)).

Timeline

The Regulation will apply 20 days after it is published.

What are the major implications for exporting countries?

When checking compliance with microbiological hygiene criteria in Regulation [2073/2005](#), reference laboratories in non-EU countries will be able to use the methods detailed in the draft.

Reference laboratories that use proprietary methods must ensure that those methods are certified by an independent certification body, and re-evaluated every 5 years.

Recommended Actions

Feedback on this proposal closed on 2 July 2024.

Background

The Official Controls Regulation [2017/625](#) frames the rules for designating official laboratories and performing sampling, analyses, tests, and diagnoses during official controls. It gives the European Commission a mandate to lay down the methods for sampling and for laboratory analyses, tests, and diagnoses [Art. 34.6(a)].

Until this new Regulation comes into application, Art. 34.2 of the Official Controls Regulation applies. Official laboratories can use only methods that comply with relevant internationally recognised rules or protocols, including those of the European Committee for Standardisation (CEN).
