Background information on the Biocidal Products Regulation

Regulation (EU) [528/2012](#) of the European Parliament and of the Council of 22 May 2012 concerning the making available on the market and use of biocidal products

Update

The Biocidal Products Regulation is the legal framework for the authorisation and use of biocidal products, which include household disinfectants, insecticides, and other chemicals used to control pests (parasites, fungi, bacteria, etc.) or to protect materials. These products, commonly used in the food chain, can pose risks to humans, animals and the environment.

Background

Substances used to suppress, eradicate and prevent organisms that are considered harmful are grouped under the term “pesticide”. The term includes both plant protection products (used on plants in agriculture, horticulture, parks and gardens) and biocidal products (used in other applications, for example, as a disinfectant or to protect materials) ([European Parliament 2017](#)).

Biocides are typically classified into four groups based on their intended use (see Table 1).

- 1 Disinfectants: includes biocides used to kill or inactivate microorganisms on inanimate objects, e.g. chlorine, hydrogen peroxide, quaternary ammonium compounds.
- 2 Protective products: includes biocides used to protect materials from the harmful effects of microorganisms, e.g. wood preservatives, paint additives, fabric protectants.
- 3 Products for control of so-called "harmful" species: includes biocides used to control pests such as insects, rodents and plant diseases, e.g. molluscicides (used to control snails and slugs), algicides, bactericides.
- 4 Other biocidal products: includes biocides that do not fit into the other three categories.

Like plant protection products, biocidal products are approved in two stages. First, the active substance is evaluated by an EU Member State "rapporteur", who produces an assessment report that is reviewed by other Member States in the Biocidal Products Committee of the European Chemicals Agency (ECHA). The Commission's decision to approve is based on the ECHA's opinion. The approval of an active substance is granted for a defined number of years,

not exceeding 10 years, and is renewable. Second, companies may apply for permission to place their products containing the active substance on the market, by an authorisation granted either by the European Commission, or by a Member State.

The EU sets MRLs for biocides that are used in or on food and animal feed, as well as for biocides that are used in other non-food applications. The MRLs are set at levels considered to be safe for consumers, taking into account potential exposure to biocide residues through dietary and other sources.

What are the major implications for exporting countries?

Agri-food suppliers in non-EU countries may face problems exporting to the EU if biocidal products used when supplying food (e.g. during storage, transport or processing) are not authorised in the EU for a specific use, or are not used correctly. Agri-food processors may also face challenges in ensuring that biocidal products used in packaging material do not pose a risk to food safety.

Any residues from biocidal products must conform with EU pesticide MRLs. Where a food is found to contain a residue that exceeds an EU MRL, the food will be non-compliant with EU law, even if no pesticide was used and the residue comes from a biocidal product.

For example, recently there have been problems with residues of chlorates in food. Residues are frequently found that are the result of by-products of chlorine solutions used as sanitising and disinfection agents in the food industry. MRLs for chlorate apply even where residues are not linked to their direct use on the food product, and can lead to food safety recalls or other regulatory action ([EFSA 2020](#)).

Contamination can result from poor rinsing of materials or packaging after the use of biocides. For example, disinfected milk tanks, fixed sprayers for vegetables in greenhouses, and small pots used for baby foods can all pose a risk to human health.

The use of biocidal products before processing, such as blanching of vegetables, can also result in the contamination of food products and pose potential health risks to consumers.

Recommended Actions

Agri-food processors must ensure that they use any biocidal products safely and appropriately, and that they keep any residues to a minimum. One strategy to minimise the risk of illegal contamination of food is to use biocides containing only active substances that are authorised in the EU.

The approval status of substances used in biocidal products can be checked on the European Chemicals Agency (ECHA) [Biocides database](#).

Suppliers must ensure that any residues in food comply with the maximum residue levels (MRLs) established for pesticides. that can be found in the [EU Pesticide Residues database](#).

Table & Figures

Table 1 Biocidal product types		
Group	Description	Product type
1 Disinfectants	Exclude cleaning products that are not intended to have a biocidal effect, including washing liquids, powders and similar products	1 Human hygiene
		2 Disinfectants and algicides not intended for direct application to humans or animals
		3 Veterinary hygiene
		4 Food and feed area
		5 Drinking water
2 Preservatives	Unless otherwise stated include only products to prevent microbial and algal development	6 Preservative for products during storage
		7 Film preservatives
		8 Wood preservatives
		9 Fibre, leather, rubber and polymerized materials preservatives
		10 Construction material preservatives
		11 Preservative for liquid cooling and processing systems
		12 Slimicides
		13 Working or cutting fluid preservatives
3 Pest control		14 Rodenticides
		15 Avicides
		16 Molluscicides, vermicides and products to control other invertebrates
		17 Piscicides
		18 Insecticides, acaricides and products to control other arthropods
		19 Repellents and attractants
		20 Control of other vertebrates
4 Other biocidal products		21 Antifouling products
		22 Embalming and taxidermist fluids
