

Maximum levels of cadmium in certain foods

Published by AGRINFO on 10 Jan 2024

EU increases maximum levels for cadmium in tiger nuts and certain cultivated fungi

Commission Regulation (EU) [2023/1510](#) of 20 July 2023 amending Regulation (EU) 2023/915 as regards maximum levels of cadmium in tiger nuts and certain cultivated fungi

Update

The EU has increased the maximum levels for cadmium in tiger nuts and certain cultivated fungi to avoid disproportionate non-compliance rates, taking into account the "as low as reasonably achievable" (ALARA) principle.

Impacted products

Fungi, tiger nuts

What is changing?

The EU has raised the maximum levels of cadmium for tiger nuts and cultivated fungi other than *Agaricus bisporus*. The changes are highlighted in Table 1.

Why?

Tiger nuts contain higher concentrations of cadmium than other radishes, and cultivated fungi other than *Agaricus bisporus* contain concentrations of cadmium higher than those present in *A. bisporus*. As contaminant levels are set following the "ALARA" principle, the maximum levels have been adjusted to reflect these higher concentrations.

Timeline

Date of effect: 10 August 2023.

Recommended Actions

Suppliers of these products should regularly monitor the presence of cadmium. Information on recommended methods for sampling and analysis of the levels of cadmium in foodstuffs can be found in Regulation [333/2007](#).

Background

The maximum level for cadmium in radishes was lowered from 0.10 to 0.020 mg/kg by Regulation (EU) [2021/1323](#), and was also applied to tiger nuts. More recent occurrence data show that tiger nuts contain higher concentrations of cadmium than radishes. However, in view of the low consumption volume of tiger nuts, their contribution to consumer exposure to cadmium is limited.

Regulation (EU) 2021/1323 also lowered the maximum levels for cultivated fungi from 0.20 to 0.050 mg/kg for *Agaricus bisporus*, the most consumed species of this group. The maximum levels for *Lentinula edodes* and *Pleurotus ostreatus* were lowered from 0.20 to 0.15 mg/kg. More recent occurrence data show that some species of cultivated fungi contain higher cadmium concentrations than *A. bisporus*.

Agaricus bisporus, *L. edodes*, and *P. ostreatus* are the main fungi consumed in the EU. Other cultivated fungi are less consumed and therefore contribute less to consumer exposure to cadmium.

Table & Figures

Table 1 Changes to maximum residue levels for cadmium			
Food category	Products	Cadmium (mg/kg)	
		Old MRL (2023/915)	New MRL (2023/1510)
Root and tuber vegetables	Radishes (other than tiger nuts)	0.02	0.02
	Tiger nuts	0.02	0.10
Fungi	<i>Agaricus bisporus</i>	0.05	0.05
	Cultivated fungi other than <i>A. bisporus</i>	0.05	0.15
