

MRL for rafoxanide in food of animal origin

Published by AGRINFO on 30 Oct 2023

Regulation [2023/2203](#) as regards the classification of the substance rafoxanide with respect to its maximum residue limit in foodstuffs of animal origin

Regulation [37/2010](#) on pharmacologically active substances and their classification regarding maximum residue limits in foodstuffs of animal origin

What is changing and why?

Rafoxanide is an antiparasitic agent that can be used against endoparasites in cattle and sheep. Following a request from the Republic of Ireland, maximum residue limits (MRLs) for rafoxanide in milk from cattle and sheep are set at 10 µg/kg.

In addition, the MRLs for rafoxanide in cattle (30 µg/kg for muscle and fat; 10 µg/kg for liver; and 40 µg/kg for kidney) now apply to all ruminants except sheep.

Actions

Countries that export muscle, fat, liver, kidney, or milk from cattle and sheep must ensure that the established residue limits of rafoxanide in those products destined for the EU are not exceeded.

Timeline

Date of application: 12 November 2023.
