

# Maximum residue levels for chlorpropham

Published by AGRINFO on 09 Jan 2025

Draft Commission Regulation as regards maximum residue levels for chlorpropham, fuberidazole, ipconazole, methoxyfenozide, S-metolachlor and triflusaluron in or on certain products

Draft Annex

## What is changing and why?

Chlorpropham is not approved in the EU, and most maximum residue levels (MRLs) will be set at the product-specific limits of determination (LOD, the lowest level that can be detected using the most modern and reliable analytical methods). A temporary MRL for chlorpropham in potatoes was previously set at 0.35 mg/kg. On the basis of new monitoring data submitted to the European Commission, it has been demonstrated that the lower level of 0.2 mg/kg is achievable, justifying a reduction in the MRL.

## Actions

Feedback on the EU proposal closed on 14 February 2025 ([G/SPS/N/EU/802](#)).

Suppliers of potatoes to the EU market should verify current good agricultural practices (GAP) to ensure compliance with a reduced MRL. It is also important to continue monitoring chlorpropham levels in potatoes so that data can be submitted to the Commission before approximately July 2027, when a new review will be carried out.

## Timeline

The new MRLs will apply from approximately March 2026 – the precise date will be known once the Regulation is published.
