

Smoke flavourings: no reauthorisation of 10 primary products

Published by AGRINFO on 09 May 2024; Revised 08 Aug 2024

EU bans the use of smoke flavouring primary products

Commission Implementing Regulation (EU) [2024/2067](#) of 31 July 2024 amending Implementing Regulation (EU) No 1321/2013 as regards the deletion of entries SF-001 to SF-010 from the Union list of authorised smoke flavouring primary products

Update

Due to safety concerns, the European Commission has not renewed the authorisation of 10 smoke flavouring primary products that expired on 1 January 2024. Some of these smoke flavourings may continue to be used until 1 July 2026, or 1 July 2029 in the case of foods that are traditionally smoked (including cheese, meat, processed fish, and fish roe).

What is changing?

Regulation [1321/2013](#) (Annex) lists smoke flavouring primary products that are authorised to be used in foods in the European Union.

In 2014, the European Commission authorised 10 smoke flavouring primary products for use in the EU until 1 January 2024. The Commission will not reauthorise smoke flavourings SF-001 to SF-006, SF008, and SF-009 (see Table 1). No application was made for the renewal of products SF-007 and SF-010.

All 10 products (SF-001 to SF-010) will therefore be deleted from the EU list.

During a transition period of 2–5 years, certain smoke flavourings may continue to be used to allow producers time to adjust their production processes or recipes (see Timeline).

Why?

Following a series of scientific opinions by the European Food Safety Authority (EFSA 2023a–h), which identified potential safety concerns for genotoxicity, the Commission will not renew its authorisation of the eight smoke flavouring primary products (SF-001 to SF-006, SF008, and SF-009) for which renewal had been requested.

Timeline

Foods containing smoke flavouring primary products SF-001 to SF-006, SF-008, or SF-009 may continue to be put on the EU market in accordance with current rules until:

- 1 July 2029 for cheese and cheese products (food category 1.7), meat (8), processed fish and fishery products (9.2), fish roe (9.3) (foods for which smoke flavourings replace traditional smoking processes)
- 1 July 2026 for all other food categories.

For further information on these food categories, see Regulation [1333/2008](#), Annex II.

Mixtures of these smoke flavouring primary products with other food ingredients may also be placed on the market for use in the food categories listed above (with the same timelines).

SF-007 and SF-010 can no longer be used.

What are the major implications for exporting countries?

Smoke flavourings are used extensively in a wide range of food products. For exporters of foods that make use of smoke flavouring primary products, adjusting production processes may take time and require significant investment. The EU therefore foresees a transition period during which these smoke flavouring primary products can still be used (see Timeline).

Recommended Actions

Exporters of foods currently containing smoke flavouring primary products must urgently review their use of these products; immediately stop using smoke flavouring SF-007 and SF-010; and aim to find alternatives to smoke flavourings SF-001 to SF-006, SF-008, or SF-009 within the transition period foreseen by the EU.

Background

Smoke flavourings are used as an alternative to the flavouring effects of traditional smoking, giving foods a particular taste rather than preserving them (which is the traditional aim of smoking). They are complex mixtures of chemical substances which are specifically regulated in the EU under Regulation [2065/2003](#).

In addition to offering an alternative to the traditional smoking process for foods such as meat, fish, and cheese, smoke flavourings are added to other food such as soups, sauces, drinks, crisps, edible ices, and confectionery ([EFSA 2023j](#)).

Only approved primary products authorised under Regulation [1321/2013](#) may be used to produce smoke flavourings. The genotoxic substances in smoke flavourings that have been identified by EFSA are also expected to be produced during traditional smoking ([BfR 2024](#)).
